

JavaScript Level One

- Welcome to the first JavaScript Section!
- This will begin to build our understanding of adding interactive functionality to our websites!

- Javascript support is built directly into modern web browsers.
- We can run Javascript directly into the browser console, or as a full .js script connected to an HTML file.

- Javascript is a full programming language, meaning unlike HTML or CSS is supports things such as arrays, loops, and general logic.
- We will briefly cover major programming concepts as we encounter them with JS!

- Eventually we will show how to use Javascript to directly change the HTML or CSS shown on a page.
- To begin with however, we will focus on just the Javascript basics by itself.

- We'll start off with JS in the console.
- Later on we will have full .js scripts and connect them to our HTML.
- All the code used in this section can be found as .js scripts under the Javascript_Level_One folder.

Let's get started!

Part 1 - Javascript Basics

 Let's go to our browser, open up our console and walk through the basics of Javascript.

Part 2 Connecting Javascript

- We learned quite a bit in the last lecture, so let's take a break and just show you how to connect Javascript to an HTML file!
- We'll open up Atom and the browser for this!

Part 3 - First JS Exercise

- Let's get some practice with your new skills!
- You will create a very simple website that takes in a weight in Imperial pounds (lbs) and converts it to kilograms.

- The HTML is already done, all your work will be in the connected .js file.
- The relevant files are:
 - Part3_Exercise.html
 - Part3.js

- At the bottom of the HTML file is the connection to the solution .js file, make sure to change it to your own .js file before you start!
- Let's quickly explore the exercise!

Part 4 - Operators

- It is time to learn about Comparison and Logical Operators with Javascript.
- These operators allow us to begin to add logic to our Javascript Code.
- There are also 5 optional quick exercises at the end of this lecture!

Part 5 - Control Flow

- Control Flow is a fundamental aspect of any full programming language.
- It allows us to execute code if a certain situation arises.
- We use it in combination with logical and comparison operators.

- In case this is your first time programming, let's briefly go over the main concepts.
- If you've programmed in other languages before, you may find it more useful just to reference the notes for the JS syntax!

- We will initiate some condition check that returns a boolean, either True or False.
- Based off those results we use control flow to execute a specific block of code.

- IF statement
- if (condition){
 //Execute some Code
 }

- IF ELSE statement
- if (condition){
 //Execute some Code
 }else{
 // Execute some other Code
 }

- IF, ELSE IF, ELSE statement
- if (condition one){ //Execute some Code }else if(condition two){ // Execute some other Code }else{ // Execute some backup Code

 Alright, let's code through some examples!

Part 6 - While Loops

- Let's learn about While Loops.
- Loops allow us to automatically repeat blocks of code.
- The While Loop will continually execute code as long as a condition remains true.

- While Loop
- while(condition){
 // Execute some code while
 // this condition is true
 }

Part 7 - For Loops

- Let's learn about For Loops
- If you've only dealt with Python before, you may want to watch this lecture as the syntax will appear quite different to you!

- For Loops allow you to continually execute code a specific number of times.
- Javascript has three types of For Loops:
 - o For loops through a number of times
 - For/In loops through a JS object
 - For/of used with arrays

- A quick note, previously we used the notation:
 - \circ num = num +1
 - num += 1
 - o num++
- These are all the same

- For Loop
- for (statement1;statement2;statement3){
 // Execute some code
 }

- Statement 1 is executed before the loop (the code block) starts.
- for (statement1; statement2; statement3){
 // Execute some code
 }

- Statement 1 is executed before the loop (the code block) starts.
- for (var i = 0;statement2;statement3){
 // Execute some code
 }

- Statement 2 defines the condition for running the loop
- for (var i = 0;statement2;statement3){
 // Execute some code
 }

- Statement 2 defines the condition for running the loop
- for (var i = 0;i<5;statement3){
 // Execute some code
 }</pre>

- Statement 3 is executed each time after the loop cycles through.
- for (var i = 0;i<5;statement3){
 // Execute some code
 }</pre>

- Statement 3 is executed each time after the loop cycles through.
- for (var i = 0;i<5;i++){
 // Execute some code
 }</pre>

- This is the most common For Loop structure you will see in Javascript
- for (var i = 0;i<5;i++){
 // Execute some code
 }</pre>

- For example a string is just a sequence of characters.
- Imagine we wanted to print each letter in a particular string.
- We could use the following...

- Print every letter
- var word = "hello"
 for (var i = 0;i < word.length ;i++){
 console.log(word[i])
 }</pre>

 Let's see some examples of these two types of For Loops, later on we will cover the For/Of method when we discuss arrays.

Part 8 - Loop Exercises

- Located under the Javascript_Level_One folder, the file is:
 - Part8_Loops_Exercise.js

Part 8 - Loop Exercises Solutions

Part 9 - JS Level One Project

- We've completed all the lectures for JS Level One, now it is time for a project!
- For this project you will be creating a simple website that asks a visitor questions using JS and the prompt() function.

- Through these questions you will secretly be checking to see if there is a spy present!
- The spy is going to answer the questions in a very particular way.

- Behind the scenes you will use JS to check for these certain correct answers to the questions.
- If you find the spy, you will leave a message in the console for them to check!

- You will need to check the Part9_JS_Project.html file for the full instructions.
- An example solution is located under Part9.js, so remember to link to your own .js script before getting started!

 Let's briefly explore the instruction page and an example!

Part 9 - JS Level One Project - Solution
